Employee Database:

An activity with 2 fragments, one for entering contact info, one to display those contacts in a recycler view. If an item is clicked in the fragment with the recycler view, the fragment were the user inputs the contacts will be populated with that info from the item. Use a database to persist the data entered.

Everything works as expected, Andy(Andrew) gave me a lot of help on the small errors I was having, leading me to get angry and nuke the first database.
